Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This area contains regions of dyad symmetry which might function as operator sites for merR, which negatively regulates the expression of the structural genes as well as its own expression. The proteins deduced from the open reading frames all have counterparts in other organisms. The 12.4 kd and 15.0 kd predicted peptides are located in the inner membrane and have no detectable precursors. The 9.4 kd peptide is soluble, is processed to a 12 kd form and is for the most part associated with the periplasm. The first 30 bases were replaced with the corrected sequence from [2]. The rest of the revisions are in the sites table.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             complement(98. .532)

Three R100 derived small circular plasmids (pSM1, pSM2, pSM5) contain ISIR. pSM2 consists of map units 82.7-89.3 (the 3' end of ISIR) in circularized form. pSM1 is the same as pSM2, except for a deletion of map units 87.4-88.6. pSM 15 consists of map units 83.4-89.3 in circularized form.

Potential -35 regions are found at positions 980-984 and 1402-1406 and -10 regions at positions 999-1006 and 1425-1431. Unidentified reading frames are found at positions 2143-2565, 4688-4924 (gtg start codon), and 4921 to 5593. [4] noted two other ORF's in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence for (3), [5] and [4] kindly provided on tape by T.K.Misra ISI from [1] was renamed ISIR after [2] discovered that there are several ISI iso-insertion sequences. The 5 and 3' ends of ISIR are approximate inverted repeats. [2] found the CDS regions annotated below conserved among several ISIs. Deletion mutations in either of these two coding frames or in the two ends of ISIR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        start codon), and 4921 to 5593. vicinity of the merR gene.

```

```
cc recombinant DNA molecule comprising a sequence encoding a chelon protein
CC which binds mercuric ions. The invention is useful for recombinantly
CC producing a protein in a host-cell, by infecting or transforming a host
CC cell capable of expressing a chelon coding sequence with a vector
CC comprising a promoter active in the host cell operably linked to a coding
CC region for the protein to produce a recombinant host cell and culturing
CC divalent mercuric ions, to take up, sequester and concentrate the heavy
CC immobilised onto a solid support, is useful for binding
CC inmobilised onto a solid support, is useful for concentrate the heavy
CC aqueous medium including biological fluids. The nucleic acid, when
CC recombinantly expressed in enteric bacteria (which are nontoxigenic and
CC compathogenic), is suitable for use in the in vivo sequestration and
CC climination of mercuric ion from gastrointestinal tracts of animals or
CC humans exposed to toxic metal ions such as mercury and/or cadmium. The
CC molecules of the invention are also useful in water treatment resins.
CC tation such as mercury or cadmium with high affinity. The present nucleic
CC acid sequence encodes the synthetic MerR chelon variant protein of the
CC threated chelons of the invention.
                                                                                                                                                                             Ş

irrigation water; waste stream; contaminated aqueous medium; biological fluid; gastrointestinal tract; chelon protein; enteric bacteria; toxic metal ion; mercury; cadmium; divalent cation; heavy metal binding protein; PCR; pASK-MBD; gene; ds.
                                                                                                                                        divalent mercuric ions, to take up, sequester and concentrate the heavy metal ions from contaminated soil, ground water, hydroponic solutions or irrigation water of waste streams. The DNA of the invention, when immobilised onto a solid support, is useful for concentrating heavy metal ions from contaminated environment waste streams or contaminated and recombinantly expressed in enteric bacteria (which are nontoxigenic and nonpathogenic), is suitable for use in the in vivo sequestration and elimination of mercuric ion from gastrointestinal tracts of animals or humans exposed to toxic metal ions such as mercury and/or cadmium. The molecules of the invention are also useful in water treatment resins. The nucleic acid of the invention is highly specific and binds divalent cation such as mercury or cadmium with high affinity. The present nucleic cation such as mercury and/or cadmium the nucleic cation such as mercury or cadmium with high affinity. The present nucleic cation such as mercury or cadmium with high affinity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed. The nucleic acid encoding the chelon protein is useful for binding the chelon protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA encoding pASK-MBD gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ABK52212 standard; DNA; 354 BP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to a new non-naturally occurring recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel non-naturally occurring recombinant DNA molecule encoding a chelon protein useful for binding divalent cation mercury from contaminated soil, water, aqueous medium including biological fluids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                12-OCT-2001; 2001WO-US31819

recombinant DNA molecule comprising a sequence encoding a chelon protein which binds mercuric ions. The invention is useful for recombinantly producing a protein in a host-cell, by infecting or transforming a host cell capable of expressing a chelon coding sequence with a vector comprising a promoter active in the host cell operably linked to a coding region for the protein to produce a recombinant host cell and culturing the recombinant host cell under conditions, where DNA is expressed.
                                                                                                                                                                                                                                                                                                                                            Novel non-naturally occurring recombinant DNA molecule encoding a chelon protein useful for binding divalent cation mercury from contaminated soil, water, aqueous medium including biological fluids
                                                                                                                                                                                                                           The present invention relates to a new non-naturally occurring
                                                                                                                                                                                                                                                                                               Disclosure; Page 25; 42pp; English.
